

Abstract

A device management system and method for use with a computer network are provided. The method typically includes, in response to connection of the device to the network, sending a message from the device to the management application via a well-known communication channel, announcing the presence of the device on the network. The device may be preconfigured with an agent and a codelet pair, and the method may include sending the agent from the device to the management server. The method may also include setting a policy from the management application governing codelet operations on the device. The method may further include subscribing from the management application for notifications of codelet changes on the device.
